

# Exercise -- Pointers & Arrays

Run. Study what's happening.

```
#include <stdio.h>

int my_array[] = {1,23,17,4,-5,100};
int *ptr;

int main(void)
{
    int i;
    ptr = &my_array[0]; /* point our pointer to the first
                          element of the array */
    printf("\n");
    for (i = 0; i < 6; i++)
    {
        printf("A) my_array[%d] = %d \n",i,my_array[i]);
        printf("B) ptr + %d = %d \n\n",i, *(ptr + i));
    }
    return 0;
}
```

# Exercise -- Pointers & Arrays

Then Change line B to read:

`printf("ptr + %d = %d\n",i, *ptr++);` and run it again.

Then change it to:

`printf("ptr + %d = %d\n",i, *(++ptr));` and try once more.

Each time try and predict the outcome and carefully look at the actual outcome.

Write a `main()` program that prints an n by n square of characters. Divide the square into quarters, and fill each quarter with a different character. Here is the output when n=15:

```
***** . . . . .
***** . . . . .
***** . . . . .
***** . . . . .
***** . . . . .
***** . . . . .
***** . . . . .
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
$$$$$$$ ooooooooo
```

For extra fun, make n and the characters for each quadrant command line parameters. (But the answer does not do this.)

What does the following code write to the monitor?

```
#include <stdio.h>
int main( void )
{
    int  a = 44 ;
    int  b = 66 ;
    int *pa, *pb ;

    pa = &a ;
    pb = &b ;
    printf( "*pa=%d *pb=%d\n", *pa, *pb );

    *pa = *pb ;
    printf( "a=%d b=%d\n", a, b );

    system( "pause" );
    return 0;
}
```

What does the following code write to the monitor?

```
#include <stdio.h>

void functionB( int y )
{
    printf("    y=%d\n", y );
    y = 999;
    printf("    y=%d\n", y );
}

void functionA( int x )
{
    printf("  x=%d\n", x );
    x = 123;
    functionB( x );
    printf("  x=%d\n", x );
}

void main ( void )
{
    int a = 77;
    printf("a=%d\n", a );
    functionA( a );
    printf("a=%d\n", a );

    system("pause");
}
```

y ~~123~~ 999

```
void functionB( int y )
{
    printf("  y=%d\n", y );
    y = 999;
    printf("  y=%d\n", y );
}
```

x ~~77~~ 123

```
void functionA( int x )
{
    printf(" x=%d\n", x );
    x = 123;
    functionB( x );
    printf(" x=%d\n", x );
}
```

a 77

```
void main ( )
{
    int a = 77;
    printf("a=%d\n", a );
    functionA( a );
    printf("a=%d\n", a );

    system("pause");
}
```

In this puzzle `main()` calls `functionA()` which calls `functionB()`. Of course, call by value is used for all these calls and changes made by a function to its parameter do not affect any variable in the caller.

In the following, `main()` calls `swap()` to reverse the values in the variables `a` and `b`. But what really happens?

```
#include <stdio.h>

void swap( int x, int y )
{
    int temp;

    printf("  x=%d  y=%d\n", x, y ) ;
    temp = x;
    x = y;
    y = temp;
    printf("  x=%d  y=%d\n", x, y ) ;
}

void main ( void )
{
    int a = 44, b = 77 ;

    printf("a=%d  b=%d\n", a, b ) ;
    swap( a, b ) ;
    printf("a=%d  b=%d\n", a, b ) ;

    system("pause") ;
}
```

This puzzle shows a classic C programming error. Be sure you understand what goes wrong.

Then, fix the swap function.
